

Informative and competent pre-consultation thanks to fast results with the online diagrams or PDF files.

The provision of this calculation service does not constitute an offer and is not binding. By using this calculation service no contract whatsoever – neither an information agreement nor a consultancy contract – will be concluded between the user of this calculation service and the operator of this calculation service, nor companies for whose products the calculation service is used.

This calculation service acts only as a guide that can serve for the preliminary acoustical computation of Heradesign acoustic ceilings. It offers an approximate calculation, the results of which provide sufficient accuracy for the purpose of a preliminary computation of a room. Depending on the requirements, the calculation is made according to DIN 18041 or ÖNORM B 8115-3. The calculation service offers a dialogue-based entry and the presentation of results in the form of a diagram. This calculation service has been carefully programmed and the product data has been carefully compiled.

Despite thoroughly checking all contents, errors and mistakes cannot be ruled out. This calculation service can in no case substitute an exact calculation for a specific application by a building physicist or appropriate expert; such a calculation has to be made by one of the aforementioned persons. In particular, exact tuning of the reverberation time is not possible.

The operator of this calculation service, as well as the companies for whose products the calculation service is used, can therefore not be liable for damages as a result of using the calculation service and possible incorrect calculation results. In particular, any liability for damages (e.g. flawed planning) and consequential damages, which may be caused by using calculation results, or data or information from the calculation service, is excluded.
